## RI REPORT

>>>HDS DJDBCHDF7HN7JS893SDJ93K3JE783KE93<<<

Originating Agent: EC/TUDOR

Location: Bluffdale, Utah, USA

Dates: 9 Aug-25 Sept 2013

### Narrative:

Recent reports in sci-tech press have noted spate of construction difficulties at NSA Utah Data Center in US (see reference: <http://arstechnica.com/information-technology/2013/10/meltdowns-at-nsa-spy-data-center-destroy-equipment-delay-opening/>). Described either as "arc fault failures" or inside "lightning flashes," these infrastructure problems have caused cascading meltdowns that have set back Data Center operations by more than a year. This is the official story.

AU/COEFFICIENT monitoring has detected a series of coordinated cyber-attacks on Data Center systems originating from ghosted servers throughout South America that correspond with timeline for data center attacks. However, further attempts to trace origin obfuscated by sophisticated system of spoofed servers managed by virulent but as yet unidentified bot-net.

Internal NSA parameters have classified this incursion as STORMFRONT, and NSA has apparently tasked secret unit within Q Directorate rumored to hunt so-called "Ghosts in the Machine" as key agency coordinating STORMFRONT. Previous AU/COEFFICIENT intercepts suggest the agency is known internally as MJOLNIR.

### Suggested Action:

1. Task INTCEN with evaluating cyber-attacks in EU that match STORMFRONT profile.
2. Investigate MJOLNIR activities in Europe.
